6.1. SCOPE

6.2. NORMATIVE REFERENCE

6.3. TERMS AND DEFINITIONS

6.4. CONTEXT OF THE ORGANIZATION

6.4.1. Understanding the organization and its context

6.4.2. Understanding the needs and expectations of interested parties

6.4.3. Determining the scope of the quality management system

6.4.4. Quality management system and its processes

6.5. LEADERSHIP

6.5.1. Leadership and commitment

6.5.1.1. General

6.5.1.2. Customer focus

6.5.2. Policy

6.5.2.1. Establishing the quality policy

6.5.2.2. Communicating the quality policy

6.5.3. Organizational roles, responsibilities and authorities

6.6. PLANNING

6.6.1. Actions to address risks and opportunities

6.6.2. Quality objectives and planning to achieve them

6.6.3. Planning of changes

6.7. SUPPORT

6.7.1. Resources

6.7.1.1. General

6.7.1.2. People

6.7.1.3. Infrastructure

6.7.1.4. Environment for the operation of process

6.7.1.5. Monitoring and measuring resources

6.7.1.5.1. General

6.7.1.5.2. Measurement traceability

6.7.1.6. Organizational knowledge

6.7.2. Competence

6.7.3. Awareness

6.7.4. Communication

6.7.5. Documented information

6.7.5.1. General

6.7.5.2. Creating and updating

6.7.5.3. Control of documented information

6.8. OPERATION

6.8.1. Operational planning and control

6.8.2. Requirements for products and services

6.8.2.1. Customer communication

6.8.2.2. Determining the requirements for products and services

6.8.2.3. Review of the requirements for products and services

6.8.2.4. Changes to requirements for products and services

6.8.3. Design and development of products and services

6.8.3.1. General

6.8.3.2. Design and development planning

6.8.3.3. Design and development inputs

6.8.3.4. Design and development controls

6.8.3.5. Design and development outputs

6.8.4. Control of externally provided processes, products and services

6.8.4.1. General

6.8.4.2. Type and extent of control

6.8.4.3. Information for external providers

6.8.5. Production and service provision

6.8.5.1. Control of production and service provision

6.8.5.2. Identification and traceability

6.8.5.3. Property belonging to customers or external providers

6.8.5.4. Preservation

6.8.5.5. Post-delivery activities

6.8.5.6. Control of changes

6.8.6. Release of products and services

6.8.7. Control of nonconforming outputs

6.9. PERFORMANCE EVALUATION

6.9.1. Monitoring, measurement, analysis and evaluation

6.9.1.1. General

6.9.1.2. Customer satisfaction

6.9.1.3. Analysis and evaluation

6.9.2. Internal audit

6.9.3. Management review

6.9.3.1. General

6.9.3.2. Management review inputs

6.9.3.3. Management review outputs

6.10. IMPROVEMENT

6.10.1. General

6.10.2. Nonconformity and corrective action

6.10.3. Continual improvement

7. CERTIFICATION

7.1. PLANNING PROCESS

7.1.1. Planning Process Objectives

7.1.2. Planning Process Activities

7.2. HARDWARE DESIGN PROCESS

7.2.1. Requirements Capture Process

7.2.2. Conceptual Design Process

7.2.3. Detailed Design Process

7.2.4. Implementation Process

7.2.5. Production Transition

7.2.6. Acceptance Test

7.2.7. Series Production

7.3. VALIDATION AND VERIFICATION PROCESS

7.3.1. Validation Process

7.3.2. Verification Process

- 7.7.1.3. Hardware Validation Plan
- 7.7.1.4. Hardware Verification Plan
- 7.7.1.5. Hardware Configuration Management Plan
- 7.7.1.6. Hardware Process Assurance Plan
- 7.7.2. Hardware Design Standards and Guidance
 - 7.7.2.1. Requirements Standards
 - 7.7.2.2. Hardware Design Standards
 - 7.7.2.3. Validation and Verification Standards
 - 7.7.2.4. Hardware Archive Standards
- 7.7.3. Hardware Design Data
 - 7.7.3.1. Hardware Requirements
 - 7.7.3.2. Hardware Design Representation Data
 - 7.7.3.2.1. Conceptual Design Data
 - 7.7.3.2.2. Detailed Design Data
- 7.7.4. Validation and Verification Data
 - 7.7.4.1. Traceability Data
 - 7.7.4.2. Review and Analysis Procedures
 - 7.7.4.3. Review and Analysis Results
 - 7.7.4.4. Test Procedures
 - 7.7.4.5. Test Results

7.8. ADDITIONAL CONSIDERATIONS

- 7.8.1. Use of Previously Developed Hardware
- 7.8.2. Commercial Components Usage
- 7.8.3. Product Service Experience
- 7.8.4. Tool Assessment and Qualification

0. INTRODUCTION

A Processing Unit (PU) is an electronic system within a computer that carries out instructions of a program by performing the basic arithmetic, logic, controlling, and I/O operations specified by instructions. Instruction-

level parallelism is a measure of how many instructions in a computer can be executed simultaneously. The PU is contained on a single Metal Oxide Semiconductor (MOS) Integrated Circuit (IC).

An Automation Financial Method (AFM) is the technology and innovation that aims to compete with Traditional Financial Methods in the delivery of financial services. It is an emerging industry that uses technology to improve activities in finance. AFM is the new applications, processes, products, or business models in the financial services industry, composed of complementary financial services and provided as an end-to-end process via the Internet.

0.1.2.3. RISC-V

0.1.2.3.1. RISC-V Tests type:

```
export PATH=/opt/riscv-elf-gcc/bin:${PATH}

rm -rf tests
rm -rf riscv-tests

mkdir tests
mkdir tests/dump
mkdir tests/hex

git clone --recursive https://github.com/riscv/riscv-tests
cd riscv-tests

autoconf
./configure --prefix=/opt/riscv-elf-gcc/bin
make

cd isa

source ../../elf2hex.sh

mv *.dump ../../tests/dump
mv *.hex ../../tests/hex

cd ..

make clean

elf2hex.sh:
riscv64-unknown-elf-objcopy -O ihex rv32mi-p-breakpoint rv32mi-p-breakpoint.hex
riscv64-unknown-elf-objcopy -O ihex rv32mi-p-csr rv32mi-p-csr.hex
...
riscv64-unknown-elf-objcopy -O ihex rv64um-v-remw rv64um-v-remw.hex

type:
export PATH=/opt/riscv-elf-gcc/bin:${PATH}

spike rv32mi-p-breakpoint
spike rv32mi-p-csr
...
spike rv64um-v-remw
```

0.1.2.3.2. RISC-V Bare Metal type:

```
rm -rf hello_c.elf
rm -rf hello_c.hex
```

```
export PATH=/opt/riscv-elf-gcc/bin:${PATH}

riscv64-unknown-elf-gcc -o hello_c.elf hello_c.c
riscv64-unknown-elf-objcopy -O ihex hello_c.elf hello_c.hex
```

C Language:

```
#include <stdio.h>

int main() {
    printf("Hello QueenField!\n");
    return 0;
}
```

type:

```
export PATH=/opt/riscv-elf-gcc/bin:${PATH}
```

```
spike pk hello_c.elf
```

type:

```
rm -rf hello_cpp.elf
rm -rf hello_cpp.hex
```

```
export PATH=/opt/riscv-elf-gcc/bin:${PATH}
```

```
riscv64-unknown-elf-g++ -o hello_cpp.elf hello_cpp.cpp
riscv64-unknown-elf-objcopy -O ihex hello_cpp.elf hello_cpp.hex
```

C++ Language:

```
#include <iostream>

int main() {
    std::cout << "Hello QueenField!\n";
    return 0;
}
```

type:

```
export PATH=/opt/riscv-elf-gcc/bin:${PATH}
```

```
spike pk hello_cpp.elf
```

type:

```
rm -rf hello_go.elf
rm -rf hello_go.hex
```

```
export PATH=/opt/riscv-elf-gcc/bin:${PATH}
export PATH=/opt/riscv-go/bin:${PATH}
```

```
GOOS=linux GOARCH=riscv64 go build -o hello_go.elf hello_go.go
riscv64-unknown-elf-objcopy -O ihex hello_go.elf hello_go.hex
```

Go Language:

```
package main

import "fmt"
```

```
func main() {
    fmt.Println("Hello QueenField!")
}
```

0.1.2.3.3. RISC-V Operating System

- GNU Linux

Building BusyBox

type:

```
export PATH=/opt/riscv-elf-gcc/bin:${PATH}

git clone --recursive https://git.busybox.net/busybox
```

```
cd busybox
make CROSS_COMPILE=riscv64-unknown-linux-gnu- defconfig
make CROSS_COMPILE=riscv64-unknown-linux-gnu-
```

Building Linux

type:

```
export PATH=/opt/riscv-elf-gcc/bin:${PATH}

git clone --recursive https://github.com/torvalds/linux

cd linux
make ARCH=riscv CROSS_COMPILE=riscv64-unknown-linux-gnu- defconfig
make ARCH=riscv CROSS_COMPILE=riscv64-unknown-linux-gnu-
```

Running Linux

type:

```
export PATH=/opt/riscv-elf-gcc/bin:${PATH}

qemu-system-riscv64 -nographic -machine virt \
-kernel Image -append "root=/dev/vda ro console=ttyS0" \
-drive file=busybox,format=raw,id=hd0 \
-device virtio-blk-device,drive=hd0
```

Running Linux RISC-V 32 bit with Buildroot

type:

```
export PATH=/opt/riscv-elf-gcc/bin:${PATH}

git clone --recursive https://github.com/buildroot/buildroot

cd buildroot
make qemu_riscv32_virt_defconfig
make

qemu-system-riscv32 \
-M virt \
-nographic \
-bios output/images/fw_jump.elf \
-kernel output/images/Image \
```

```
-append "root=/dev/vda ro" \
-drive file=output/images/rootfs.ext2,format=raw,id=hd0 \
-device virtio-blk-device,drive=hd0 \
-netdev user,id=net0 \
-device virtio-net-device,netdev=net0
```

Running Linux RISC-V 64 bit with Buildroot

type:

```
export PATH=/opt/riscv-elf-gcc/bin:${PATH}
```

```
git clone --recursive https://github.com/buildroot/buildroot
```

```
cd buildroot
make qemu_riscv64_virt_defconfig
make
```

```
qemu-system-riscv64 \
-M virt \
-nographic \
-bios output/images/fw_jump.elf \
-kernel output/images/Image \
-append "root=/dev/vda ro" \
-drive file=output/images/rootfs.ext2,format=raw,id=hd0 \
-device virtio-blk-device,drive=hd0 \
-netdev user,id=net0 \
-device virtio-net-device,netdev=net0
```

- GNU Hurd

0.1.2.3.4. RISC-V Distribution

- GNU Debian
- GNU Fedora

Running Fedora

type:

```
export PATH=/opt/riscv-elf-gcc/bin:${PATH}
```

```
qemu-system-riscv64 \
-nographic \
-machine virt \
-smp 4 \
-m 2G \
-kernel Fedora-RISCV.elf \
-bios none \
-object rng-random,filename=/dev/urandom,id=rng0 \
-device virtio-rng-device,rng=rng0 \
-device virtio-blk-device,drive=hd0 \
-drive file=Fedora-RISCV.raw,format=raw,id=hd0 \
-device virtio-net-device,netdev=usernet \
-netdev user,id=usernet,hostfwd=tcp::10000-:22
```

0.2. OPEN SOURCE PHILOSOPHY

For Windows Users!

2. PROJECTS

2.1. INTERFACE

2.1.1. INSTRUCTION CACHE

2.1.1.1 Instruction INPUTS/OUTPUTS AMBA4 AXI-Lite Bus

2.1.1.1.1. Signals of the Read and Write Address channels

Write Port	Read Port	Size	Direction	Description
AWID	ARID	AXI_ID_WIDTH	Output	Address ID, to identify multiple streams
AWADDR	ARADDR	AXI_ADDR_WIDTH	Output	Address of the first beat of the burst
AWLEN	ARLEN	8	Output	Number of beats inside the burst
AWSIZE	ARSIZE	3	Output	Size of each beat
AWBURST	ARBURST	2	Output	Type of the burst
AWLOCK	ARLOCK	1	Output	Lock type, to provide atomic operations
AWCACHE	ARCACHE	4	Output	Memory type, progress through the system
AWPROT	ARPROT	3	Output	Protection type
AWQOS	ARQOS	4	Output	Quality of Service of the transaction
AWREGION	ARREGION	4	Output	Region identifier, physical to logical
AWUSER	ARUSER	AXI_USER_WIDTH	Output	User-defined data
AWVALID	ARVALID	1	Output	xVALID handshake signal
AWREADY	ARREADY	1	Input	xREADY handshake signal

2.1.1.1.2. Signals of the Read and Write Data channels

Write Port	Read Port	Size	Direction	Description
WID	RID	AXI_ID_WIDTH	Output	Data ID, to identify multiple streams
WDATA	RDATA	AXI_DATA_WIDTH	Output	Read/Write data
--	RRESP	2	Output	Read response, current RDATA status
WSTRB	--	AXI_STRB_WIDTH	Output	Byte strobe, WDATA signal
WLAST	RLAST	1	Output	Last beat identifier
WUSER	RUSER	AXI_USER_WIDTH	Output	User-defined data
WVALID	RVALID	1	Output	xVALID handshake signal
WREADY	RREADY	1	Input	xREADY handshake signal

2.1.1.1.3. Signals of the Write Response channel

Write Port	Size	Direction	Description
BID	AXI_ID_WIDTH	Input	Write response ID, to identify multiple streams
BRESP	2	Input	Write response, to specify the burst status
BUSER	AXI_USER_WIDTH	Input	User-defined data
BVALID	1	Input	xVALID handshake signal
BREADY	1	Output	xREADY handshake signal

2.1.1.2. Instruction INPUTS/OUTPUTS AMBA3 AHB-Lite Bus

Port	Size	Direction	Description
HRESETn	1	Input	Asynchronous Active Low Reset
HCLK	1	Input	System Clock Input
IHSEL	1	Output	Instruction Bus Select
IHADDR	PLEN	Output	Instruction Address Bus
IHRDATA	XLEN	Input	Instruction Read Data Bus
IHWDATA	XLEN	Output	Instruction Write Data Bus
IHWRITE	1	Output	Instruction Write Select
IHSIZE	3	Output	Instruction Transfer Size
IHBURST	3	Output	Instruction Transfer Burst Size
IHPROT	4	Output	Instruction Transfer Protection Level
IHTRANS	2	Output	Instruction Transfer Type
IHMASTLOCK	1	Output	Instruction Transfer Master Lock
IHREADY	1	Input	Instruction Slave Ready Indicator
IHRESP	1	Input	Instruction Transfer Response

2.1.1.3. Instruction INPUTS/OUTPUTS Wishbone Bus

Port	Size	Direction	Description
rst	1	Input	Synchronous Active High Reset
clk	1	Input	System Clock Input
iadr	AW	Input	Instruction Address Bus
idati	DW	Input	Instruction Input Bus
idato	DW	Output	Instruction Output Bus
isel	DW/8	Input	Byte Select Signals
iwe	1	Input	Write Enable Input

Port	Size	Direction	Description
istb	1	Input	Strobe Signal/Core Select Input
icyc	1	Input	Valid Bus Cycle Input
iack	1	Output	Bus Cycle Acknowledge Output
ierr	1	Output	Bus Cycle Error Output
iint	1	Output	Interrupt Signal Output

2.1.2. DATA CACHE

2.1.2.1. Data INPUTS/OUTPUTS AMBA4 AXI-Lite Bus

2.1.2.1.1. Signals of the Read and Write Address channels

Write Port	Read Port	Size	Direction	Description
AWID	ARID	AXI_ID_WIDTH	Output	Address ID, to identify multiple streams
AWADDR	ARADDR	AXI_ADDR_WIDTH	Output	Address of the first beat of the burst
AWLEN	ARLEN	8	Output	Number of beats inside the burst
AWSIZE	ARSIZE	3	Output	Size of each beat
AWBURST	ARBURST	2	Output	Type of the burst
AWLOCK	ARLOCK	1	Output	Lock type, to provide atomic operations
AWCACHE	ARCACHE	4	Output	Memory type, progress through the system
AWPROT	ARPROT	3	Output	Protection type
AWQOS	ARQOS	4	Output	Quality of Service of the transaction
AWREGION	ARREGION	4	Output	Region identifier, physical to logical
AWUSER	ARUSER	AXI_USER_WIDTH	Output	User-defined data
AWVALID	ARVALID	1	Output	xVALID handshake signal
AWREADY	ARREADY	1	Input	xREADY handshake signal

2.1.2.1.2. Signals of the Read and Write Data channels

Write Port	Read Port	Size	Direction	Description
WID	RID	AXI_ID_WIDTH	Output	Data ID, to identify multiple streams
WDATA	RDATA	AXI_DATA_WIDTH	Output	Read/Write data
--	RRESP	2	Output	Read response, current RDATA status
WSTRB	--	AXI_STRB_WIDTH	Output	Byte strobe, WDATA signal
WLAST	RLAST	1	Output	Last beat identifier
WUSER	RUSER	AXI_USER_WIDTH	Output	User-defined data
WVALID	RVALID	1	Output	xVALID handshake signal
WREADY	RREADY	1	Input	xREADY handshake signal

2.1.2.1.3. Signals of the Write Response channel

Write Port	Size	Direction	Description
BID	AXI_ID_WIDTH	Input	Write response ID, to identify multiple streams
BRESP	2	Input	Write response, to specify the burst status
BUSER	AXI_USER_WIDTH	Input	User-defined data
BVALID	1	Input	xVALID handshake signal
BREADY	1	Output	xREADY handshake signal

2.1.2.2. Data INPUTS/OUTPUTS AMBA3 AHB-Lite Bus

Port	Size	Direction	Description
HRESETn	1	Input	Asynchronous Active Low Reset
HCLK	1	Input	System Clock Input
DHSEL	1	Output	Data Bus Select
DHADDR	PLEN	Output	Data Address Bus
DHRDATA	XLEN	Input	Data Read Data Bus
DHWDATA	XLEN	Output	Data Write Data Bus
DHWRITE	1	Output	Data Write Select
DHSIZE	3	Output	Data Transfer Size
DHBURST	3	Output	Data Transfer Burst Size
DHPROT	4	Output	Data Transfer Protection Level
DHTRANS	2	Output	Data Transfer Type
DHMASTLOCK	1	Output	Data Transfer Master Lock
DHREADY	1	Input	Data Slave Ready Indicator
DHRESP	1	Input	Data Transfer Response

2.1.2.3. Data INPUTS/OUTPUTS Wishbone Bus

Port	Size	Direction	Description
rst	1	Input	Synchronous Active High Reset
clk	1	Input	System Clock Input
dadr	AW	Input	Data Address Bus
ddati	DW	Input	Data Input Bus
ddato	DW	Output	Data Output Bus
dsel	DW/8	Input	Byte Select Signals
dwe	1	Input	Write Enable Input
dstb	1	Input	Strobe Signal/Core Select Input
dcyc	1	Input	Valid Bus Cycle Input
dack	1	Output	Bus Cycle Acknowledge Output
derr	1	Output	Bus Cycle Error Output
dint	1	Output	Interrupt Signal Output

4. HARDWARE WORKFLOW

1. System Level (SystemC/SystemVerilog)

The System Level abstraction of a system only looks at its biggest building blocks like processing units or peripheral devices. At this level the circuit is usually described using traditional programming languages like SystemC or SystemVerilog. Sometimes special software libraries are used that are aimed at simulation circuits on the system level. The IEEE 1685-2009 standard defines the IP-XACT file format that can be used to represent designs on the system level and building blocks that can be used in such system level designs.

2. Behavioral & Register Transfer Level (VHDL/Verilog)

At the Behavioural Level abstraction a language aimed at hardware description such as Verilog or VHDL is used to describe the circuit, but so-called behavioural modeling is used in at least part of the circuit description. In behavioural modeling there must be a language feature that allows for imperative programming to be used to describe data paths and registers. This is the always -block in Verilog and the process -block in VHDL.

A design in Register Transfer Level representation is usually stored using HDLs like Verilog and VHDL. But only a very limited subset of features is used, namely minimalistic always blocks (Verilog) or process blocks (VHDL) that model the register type used and unconditional assignments for the datapath logic. The use of HDLs on this level simplifies simulation as no additional tools are required to simulate a design in Register Transfer Level representation.

3. Logical Gate

At the Logical Gate Level the design is represented by a netlist that uses only cells from a small number of single-bit cells, such as basic logic gates (AND, OR, NOT, XOR, etc.) and registers (usually D-Type Flip-flops). A number of netlist formats exists that can be used on this level such as the Electronic Design Interchange Format (EDIF), but for ease of simulation often a HDL netlist is used. The latter is a HDL file (Verilog or VHDL) that only uses the most basic language constructs for instantiation and connecting of cells.

4. Physical Gate

On the Physical Gate Level only gates are used that are physically available on the target architecture. In some cases this may only be NAND, NOR and NOT gates as well as D-Type registers. In the case of an FPGA-based design the Physical Gate Level representation is a netlist of LUTs with optional output registers, as these are the basic building blocks of FPGA logic cells.

5. Switch Level

A Switch Level representation of a circuit is a netlist utilizing single transistors as cells. Switch Level modeling is possible in Verilog and VHDL, but is seldom used in modern designs, as in modern digital ASIC or FPGA flows the physical gates are considered the atomic build blocks of the logic circuit.

1. Settings → Apps → Apps & features → Related settings, Programs and Features → Turn Windows features on or off → Windows Subsystem for Linux
2. Microsoft Store → INSTALL UBUNTU

Front-End and Back-End Library type:

```
sudo apt update
sudo apt upgrade
```

```
sudo apt install bison cmake flex freeglut3-dev libcairo2-dev libgsl-dev \

```

4.1. FRONT-END OPEN SOURCE TOOLS

4.1.1. Modeling System Level of Hardware

A System Description Language Editor is a computer tool that allows to generate software code. A System Description Language is a formal language, which comprises a Programming Language (input), producing a Hardware Description (output). Programming languages are used in computer programming to implement algorithms. The description of a programming language is split into the two components of syntax (form) and semantics (meaning).

System Description Language Editor

type:

```
git clone https://github.com/emacs-mirror/emacs
```

4.1.2. Simulating System Level of Hardware

A System Description Language Simulator (translator) is a computer program that translates computer code written in a Programming Language (the source language) into a Hardware Description Language (the target language). The compiler is primarily used for programs that translate source code from a high-level programming language to a low-level language to create an executable program.

SystemVerilog System Description Language Simulator

type:

```
git clone http://git.veripool.org/git/verilator
```

```
cd verilator
autoconf
./configure
make
sudo make install

cd sim/verilog/regression/wb/vtor
source simulate.sh

cd sim/verilog/regression/ahb3/vtor
source simulate.sh

cd sim/verilog/regression/axi4/vtor
source simulate.sh
```

Figure 5: Front-End

4.1.3. Verifying System Level of Hardware

A UVM standard improves interoperability and reduces the cost of repurchasing and rewriting IP for each new project or Electronic Design Automation tool. It also makes it easier to reuse verification components. The UVM Class Library provides generic utilities, such as component hierarchy, Transaction Library Model or configuration database, which enable the user to create virtually any structure wanted for the testbench.

SystemVerilog System Description Language Verifier

type:

```
git clone https://github.com/QueenField/UVM
```

4.1.4. Describing Register Transfer Level of Hardware

A Hardware Description Language Editor is any editor that allows to generate hardware code. Hardware Description Language is a specialized computer language used to describe the structure and behavior of digital logic circuits. It allows for the synthesis of a HDL into a netlist, which can then be synthesized, placed and routed to produce the set of masks used to create an integrated circuit.

Hardware Description Language Editor

type:

```
git clone https://github.com/emacs-mirror/emacs
```

4.1.5. Simulating Register Transfer Level of Hardware

A Hardware Description Language Simulator uses mathematical models to replicate the behavior of an actual hardware device. Simulation software allows for modeling of circuit operation and is an invaluable analysis tool. Simulating a circuit's behavior before actually building it can greatly improve design efficiency by making faulty designs known as such, and providing insight into the behavior of electronics circuit designs.

VHDL Hardware Description Language Simulator

type:

```
git clone https://github.com/ghdl/ghdl
```

```
cd ghdl
./configure --prefix=/usr/local
make
sudo make install

cd sim/vhdl/regression/wb/ghdl
source simulate.sh

cd sim/vhdl/regression/ahb3/ghdl
source simulate.sh

cd sim/vhdl/regression/axi4/ghdl
source simulate.sh
```

Verilog Hardware Description Language Simulator

type:

```
git clone https://github.com/steveicarus/iverilog
```

```
cd iverilog
sh autoconf.sh
./configure
make
```

```

sudo make install

cd sim/verilog/regression/wb/iverilog
source simulate.sh

cd sim/verilog/regression/ahb3/iverilog
source simulate.sh

cd sim/verilog/regression/axi4/iverilog
source simulate.sh

```

4.1.6. Synthesizing Register Transfer Level of Hardware

A Hardware Description Language Synthesizer turns a RTL implementation into a Logical Gate Level implementation. Logical design is a step in the standard design cycle in which the functional design of an electronic circuit is converted into the representation which captures logic operations, arithmetic operations, control flow, etc. In EDA parts of the logical design is automated using synthesis tools based on the behavioral description of the circuit.

Verilog Hardware Description Language Synthesizer

type:

```
git clone https://github.com/YosysHQ/yosys
```

```

cd yosys
make
sudo make install

cd synthesis/yosys
source synthesize.sh

```

VHDL Hardware Description Language Synthesizer

type for Plugin:

```

git clone https://github.com/ghdl/ghdl-yosys-plugin

cd ghdl-yosys-plugin
make GHDL=/usr/local
sudo yosys-config --exec mkdir -p --datdir/plugins
sudo yosys-config --exec cp "ghdl.so" --datdir/plugins/ghdl.so

cd synthesis/yosys
source synthesize.sh

```

4.1.7. Optimizing Register Transfer Level of Hardware

A Hardware Description Language Optimizer finds an equivalent representation of the specified logic circuit under specified constraints (minimum area, pre-specified delay). This tool combines scalable logic optimization based on And-Inverter Graphs (AIGs), optimal-delay DAG-based technology mapping for look-up tables and standard cells, and innovative algorithms for sequential synthesis and verification.

Verilog Hardware Description Language Optimizer

type:

```
git clone https://github.com/YosysHQ/yosys
```

```

cd yosys
make
sudo make install

```

```
cd synthesis/yosys
source synthesize.sh
```

4.1.8. Verifying Register Transfer Level of Hardware

A Hardware Description Language Verifier proves or disproves the correctness of intended algorithms underlying a hardware system with respect to a certain formal specification or property, using formal methods of mathematics. Formal verification uses modern techniques (SAT/SMT solvers, BDDs, etc.) to prove correctness by essentially doing an exhaustive search through the entire possible input space (formal proof).

Verilog Hardware Description Language Verifier

type:

```
git clone https://github.com/YosysHQ/SymbiYosys
```

4.2. BACK-END OPEN SOURCE TOOLS

Library

type:

```
sudo apt update
sudo apt upgrade
```

```
sudo apt install bison cmake flex freeglut3-dev libcairo2-dev libgsl-dev \
libncurses-dev libx11-dev m4 python-tk python3-tk swig tcl tcl-dev tk-dev tcsh
```

Back-End Workflow Qflow

type:

```
git clone https://github.com/RTimothyEdwards/qflow
```

```
cd qflow
./configure
make
sudo make install

mkdir qflow
cd qflow
```

4.2.1. Planning Switch Level of Hardware

A Floor-Planner of an Integrated Circuit (IC) is a schematic representation of tentative placement of its major functional blocks. In modern electronic design process floor-plans are created during the floor-planning design stage, an early stage in the hierarchical approach to Integrated Circuit design. Depending on the design methodology being followed, the actual definition of a floor-plan may differ.

Floor-Planner

type:

```
git clone https://github.com/RTimothyEdwards/magic
```

```
cd magic
./configure
make
sudo make install
```

Figure 6: Back-End

4.2.2. Placing Switch Level of Hardware

A Standard Cell Placer takes a given synthesized circuit netlist together with a technology library and produces a valid placement layout. The layout is optimized according to the aforementioned objectives and ready for cell resizing and buffering, a step essential for timing and signal integrity satisfaction. Physical design flow are iterated a number of times until design closure is achieved.

Standard Cell Placer

type:

```
git clone https://github.com/rubund/graywolf
```

```
cd graywolf
mkdir build
cd build
cmake ..
make
sudo make install
```

4.2.3. Timing Switch Level of Hardware

A Standard Cell Timing-Analyzer is a simulation method of computing the expected timing of a digital circuit without requiring a simulation of the full circuit. High-performance integrated circuits have traditionally been characterized by the clock frequency at which they operate. Measuring the ability of a circuit to operate at the specified speed requires an ability to measure, during the design process, its delay at numerous steps.

Standard Cell Timing-Analyzer

type:

```
git clone https://github.com/The-OpenROAD-Project/OpenSTA
```

```
cd OpenSTA
mkdir build
cd build
cmake ..
make
sudo make install
```

4.2.4. Routing Switch Level of Hardware

A Standard Cell Router takes pre-existing polygons consisting of pins on cells, and pre-existing wiring called pre-routes. Each of these polygons are associated with a net. The primary task of the router is to create geometries such that all terminals assigned to the same net are connected, no terminals assigned to different nets are connected, and all design rules are obeyed.

Standard Cell Router

type:

```
git clone https://github.com/RTimothyEdwards/qrouter
```

```
cd qrouter
./configure
make
sudo make install
```

4.2.5. Simulating Switch Level of Hardware

A Standard Cell Simulator treats transistors as ideal switches. Extracted capacitance and lumped resistance values are used to make the switch a little bit more realistic than the ideal, using the RC time constants to predict the relative timing of events. This simulator represents a circuit in terms of its exact transistor structure but describes the electrical behavior in a highly idealized way.

Standard Cell Simulator

type:

```
git clone https://github.com/RTimothyEdwards/irsim
```

```
cd irsim
./configure
make
sudo make install
```

4.2.6. Verifying Switch Level of Hardware LVS

A Standard Cell Verifier compares netlists, a process known as LVS (Layout vs. Schematic). This step ensures that the geometry that has been laid out matches the expected circuit. The greatest need for LVS is in large analog or mixed-signal circuits that cannot be simulated in reasonable time. LVS can be done faster than simulation, and provides feedback that makes it easier to find errors.

Standard Cell Verifier

type:

```
git clone https://github.com/RTimothyEdwards/netgen
```

```
cd netgen
./configure
make
sudo make install

cd synthesis/qflow
source flow.sh
```

4.2.7. Checking Switch Level of Hardware DRC

A Standard Cell Checker is a geometric constraint imposed on Printed Circuit Board (PCB) and Integrated Circuit (IC) designers to ensure their designs function properly, reliably, and can be produced with acceptable yield. Design Rules for production are developed by hardware engineers based on the capability of their processes to realize design intent. Design Rule Checking (DRC) is used to ensure that designers do not violate design rules.

Standard Cell Checker

type:

```
git clone https://github.com/RTimothyEdwards/magic
```

```
cd magic
./configure
make
sudo make install
```

4.2.8. Printing Switch Level of Hardware GDS

A Standard Cell Editor allows to print a set of standard cells. The standard cell methodology is an abstraction, whereby a low-level VLSI layout is encapsulated into a logical representation. A standard cell is a group of transistor and interconnect structures that provides a boolean logic function (AND, OR, XOR, XNOR, inverters) or a storage function (flipflop or latch).

Standard Cell Editor

type:

```
git clone https://github.com/RTimothyEdwards/magic
```

```
cd magic
./configure
make
sudo make install
```

5.1.1. MSP430

5.1.1.1. MSP430 GNU C/C++

5.1.1.2. MSP430 GNU Go

5.1.2. OpenRISC

5.1.2.1. OpenRISC GNU C/C++

5.1.2.2. OpenRISC GNU Go

5.1.3. RISC-V

5.1.3.1. RISC-V GNU C/C++ type:

```
git clone --recursive https://github.com/riscv/riscv-gnu-toolchain
```

```
cd riscv-gnu-toolchain
```

```
./configure --prefix=/opt/riscv-elf-gcc
sudo make clean
sudo make
```

```
./configure --prefix=/opt/riscv-elf-gcc
sudo make clean
sudo make linux
```

```
./configure --prefix=/opt/riscv-elf-gcc --enable-multilib
```

```
sudo make clean
sudo make linux
```

5.1.3.2. RISC-V GNU Go type:

```
git clone --recursive https://go.googlesource.com/go riscv-go
cd riscv-go/src
./all.bash
cd ../../
sudo mv riscv-go /opt
```

5.2. FRONT-END OPEN SOURCE TOOLS

5.2.1. MSP430

5.2.2. OpenRISC

5.2.3. RISC-V

type:

```
sudo apt install device-tree-compiler libglb2.0-dev libpixmap-1-dev pkg-config
```

5.2.3.1. Hardware Engineers Compiler: Spike Building Proxy Kernel

type:

```
export PATH=/opt/riscv-elf-gcc/bin:${PATH}

git clone --recursive https://github.com/riscv/riscv-pk

cd riscv-pk
mkdir build
cd build
../configure --prefix=/opt/riscv-elf-gcc --host=riscv64-unknown-elf
make
sudo make install
```

Building Spike

type:

```
export PATH=/opt/riscv-elf-gcc/bin:${PATH}

git clone --recursive https://github.com/riscv/riscv-isa-sim

cd riscv-isa-sim
mkdir build
cd build
../configure --prefix=/opt/riscv-elf-gcc
make
sudo make install
```

5.2.3.2. Software Engineers Compiler: QEMU type:

```
export PATH=/opt/riscv-elf-gcc/bin:${PATH}

git clone --recursive https://github.com/qemu/qemu
```

```
cd qemu
./configure --prefix=/opt/riscv-elf-gcc \
--target-list=riscv64-sofmmu,riscv32-sofmmu,riscv64-linux-user,riscv32-linux-user
make
sudo make install
```

6. QUALITY ASSURANCE

6.1. SCOPE

6.2. NORMATIVE REFERENCE

6.3. TERMS AND DEFINITIONS

6.4. CONTEXT OF THE ORGANIZATION

6.4.1. Understanding the organization and its context

6.4.2. Understanding the needs and expectations of interested parties

6.4.3. Determining the scope of the quality management system

6.4.4. Quality management system and its processes

6.5. LEADERSHIP

6.5.1. Leadership and commitment

6.5.1.1. General

6.5.1.2. Customer focus

6.5.2. Policy

6.5.2.1. Establishing the quality policy

6.5.2.2. Communicating the quality policy

6.5.3. Organizational roles, responsibilities and authorities

6.6. PLANNING

6.6.1. Actions to address risks and opportunities

6.6.2. Quality objectives and planning to achieve them

6.6.3. Planning of changes

6.7. SUPPORT

6.7.1. Resources

6.7.1.1. General

6.7.1.2. People

6.7.1.3. Infrastructure

6.7.1.4. Environment for the operation of process

6.7.1.5. Monitoring and measuring resources

6.7.1.5.1. General

6.7.1.5.2. Measurement traceability

6.7.1.6. Organizational knowledge

6.7.2. Competence

6.7.3. Awareness

6.7.4. Communication

6.7.5. Documented information

6.7.5.1. General

6.7.5.2. Creating and updating

6.7.5.3. Control of documented information

6.8. OPERATION

6.8.1. Operational planning and control

6.8.2. Requirements for products and services

6.8.2.1. Customer communication

6.8.2.2. Determining the requirements for products and services

6.8.2.3. Review of the requirements for products and services

6.8.2.4. Changes to requirements for products and services

6.8.3. Design and development of products and services

6.8.3.1. General

6.8.3.2. Design and development planning

6.8.3.3. Design and development inputs

6.8.3.4. Design and development controls

6.8.3.5. Design and development outputs

6.8.4. Control of externally provided processes, products and services

6.8.4.1. General

6.8.4.2. Type and extent of control

6.8.4.3. Information for external providers

6.8.5. Production and service provision

6.8.5.1. Control of production and service provision

6.8.5.2. Identification and traceability

6.8.5.3. Property belonging to customers or external providers

6.8.5.4. Preservation

6.8.5.5. Post-delivery activities

6.8.5.6. Control of changes

6.8.6. Release of products and services

6.8.7. Control of nonconforming outputs

6.9. PERFORMANCE EVALUATION

6.9.1. Monitoring, measurement, analysis and evaluation

6.9.1.1. General

6.9.1.2. Customer satisfaction

6.9.1.3. Analysis and evaluation

6.9.2. Internal audit

6.9.3. Management review

6.9.3.1. General

6.9.3.2. Management review inputs

6.9.3.3. Management review outputs

6.10. IMPROVEMENT

6.10.1. General

6.10.2. Nonconformity and corrective action

6.10.3. Continual improvement

7. CERTIFICATION

7.1. PLANNING PROCESS

7.1.1. Planning Process Objectives

7.1.2. Planning Process Activities

7.2. HARDWARE DESIGN PROCESS

7.2.1. Requirements Capture Process

7.2.2. Conceptual Design Process

7.2.3. Detailed Design Process

7.2.4. Implementation Process

7.2.5. Production Transition

7.2.6. Acceptance Test

7.2.7. Series Production

7.3. VALIDATION AND VERIFICATION PROCESS

7.3.1. Validation Process

7.3.2. Verification Process

7.3.3. Validation and Verification Methods

7.4. CONFIGURATION MANAGEMENT PROCESS

7.4.1. Configuration Management Objectives

7.4.2. Configuration Management Activities

7.4.3. Data Control Categories

7.5. PROCESS ASSURANCE

7.5.1. Process Assurance Objectives

7.5.2. Process Assurance Activities

7.6. CERTIFICATION LIAISON PROCESS

7.6.1. Means of Compliance and Planning

7.6.2. Compliance Substantiation

7.7. HARDWARE DESIGN LIFECYCLE DATA

7.7.1. Hardware Plans

7.7.1.1. Plan for Hardware Aspects of Certification

7.7.1.2. Hardware Design Plan

7.7.1.3. Hardware Validation Plan

7.7.1.4. Hardware Verification Plan

7.7.1.5. Hardware Configuration Management Plan

7.7.1.6. Hardware Process Assurance Plan

7.7.2. Hardware Design Standards and Guidance

7.7.2.1. Requirements Standards

7.7.2.2. Hardware Design Standards

7.7.2.3. Validation and Verification Standards

7.7.2.4. Hardware Archive Standards

7.7.3. Hardware Design Data

7.7.3.1. Hardware Requirements

7.7.3.2. Hardware Design Representation Data

7.7.3.2.1. Conceptual Design Data

7.7.3.2.2. Detailed Design Data

- Top-Level Drawing
- Assembly Drawings
- Installation Control Drawings
- Hardware/Software Interface Data

7.7.4. Validation and Verification Data

7.7.4.1. Traceability Data

7.7.4.2. Review and Analysis Procedures

7.7.4.3. Review and Analysis Results

7.7.4.4. Test Procedures

7.7.4.5. Test Results

7.8. ADDITIONAL CONSIDERATIONS

7.8.1. Use of Previously Developed Hardware

7.8.2. Commercial Components Usage

7.8.3. Product Service Experience

7.8.4. Tool Assessment and Qualification
